	virus (Strain NVSL) <u>豬藍耳病病毒</u>	Glass	6 hrs	97.90%	1.68	failure in breeding stock and respiratory tract illness. The PRRS virus cost the US swine industry in excess of \$560 million in losses each year.

Antiviral and Antimicrobial efficacy of Odorox® Mobile Disinfection Unit (MDU™) Hydroxyl Generator

Kill rates of various organisms when subjected to Odorox device atmospheric hydroxyls

This document was developed to provide a useful perspective relative to the efficacy data produced by ATS Labs for the Odorox Mobile Disinfection Unit™ (MDU™) hydroxyl generator.

Anti-microbial activity requires the development of efficacy data against specific reference organisms. The term antimicrobial activity is broadly used to describe the reduction or elimination of microorganisms. To achieve broad spectrum bacterial efficacy, both classes of bacteria (Gram positive and Gram negative which are differentiated by cell wall physiologies) are evaluated. Aspergillus niger was evaluated to demonstrate fungicidal efficacy against a common and robust fungal organism

'Representative Organism' – Characteristic of the traits of this group of organisms. Kill rates effected upon this type of designated organism would be typical if applied to the rest of the organisms within that group.

When HGI Industries undertook the challenge of defining the ability of atmospheric hydroxyls to neutralize pathogens, there was a need to test the Odorox® technology against the heartiest of biological groups. This would include bacteria, virus and fungi. Since Salmonella has approximately 2,500 sub species, it was decided to evaluate kill rates involving the most difficult to neutralize; Salmonella enterica.

Of the acknowledged fungal groups, which number between 5-6 million, we sought to test Odorox® technology against the most resistant fungal specie. Aspergillus niger requires a 330,000 UV dose to achieve a 2Log reduction (99%). By comparison, Aspergillus flavus requires a dosing of 99,000 UV dose. Bacteria and virus typically require far lower dosages in order to achieve deactivation, usually between a 8,000-14,000 UV dose.

Hard and Soft Surfaces Tested – This is a remarkable achievement. Traditionally, chemicals work well on hard surfaces and tend to weaken or destroy fabrics. Odorox® technology proved equally successful on hard or soft surfaces without negative effects to fabrics.

Summary

'While making specific claims against specific organisms requires the specific efficacy data to support these claims, the Odorox[®] Mobile Disinfection Unit™ (MDU™) hydroxyl generator demonstrated that it was effective against the key representative organisms discussed above'. - Douglas G. Anderson – President, ATS Labs

NOTE: Only bacteria (Gram-negative/positive) and fungi can claim status as having representative organisms. All virus must be tested individually so as to demonstrate efficacy.

NOTE: Only Odorox technology can lay claim to these above specific benefits. Any competing technologies must produce their own data as the patented Odorox process cannot be copied.
